                                         The invention relates to identifying a binding peptide which binds a receptor and which is a member of a combinatorial library of peptides, comprising screening a combinatorial peptide library presented in the form of cells which coexpress the receptor or its ligand-binding receptor moiety and one member of the library, together with a signal producing system for reporting binding of the peptide to the receptor. Also included is a method for predicting the receptor-modulating activity of a compound which modulates the biological activity of a receptor comprising (a) identifying peptides which bind the receptor by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   any amino acid (e.g. the present peptide), and a cytoplasmic protein (CP) containing the sequence AAW50162 or AAW50163. The composition can be used to inhibit the proliferation of cancer or virally infected cells, or induce apoptosis in cancer or virally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A novel composition is capable of inhibiting specific binding between a signal-transducing protein (STP) having the between terminal sequence (Ser/Thr)-taa-(Val/Ile/Leu), where carboxy-terminal sequence (Ser/Thr)-taa-(Val/Ile/Leu), where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Androgen receptor; breast can receptor modulating compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAU86416 standard; Peptide; 31 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                peptide which binds a vertebrate, mammalian, preferably human receptor, can intracellular, nuclear, oestrogen or androgen receptor. The identified peptides which bind to the receptor are useful for predicting the receptor-modulating activity of a compound (e.g. ant/agonists). The receptor-binding library members are useful in the prediction of the cability of small organic molecules, suitable for pharmaceutical use cability of small organic molecules, suitable for pharmaceutical use cability of oestrogen receptors, for breast cancer treatment), to interact with the receptor. The analyte-binding molecules can also be used for in vivo imaging. The method has several advantages over whole canimal-based assay systems in that the same technology can be applied to a variety of different receptors, the system can be used for high throughput screening and compound characterisation, and gives very constituted the system of receptor activity using very much less protein. The present sequence is an androgen receptor binding peptide from a combinatorial peptide library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      C comprising screening a combinatorial peptide which comprising screening a combinatorial peptide (ibrary presented in the C comprising screening a combinatorial peptide (ibrary presented in the C comprising screening a combinatorial peptide (ibrary presented in the C compound which modulates the biological activity of a receptor c compound which modulates the biological activity of a receptor c compound which modulates the biological activity of a receptor c compound which modulates the biological activity of a receptor computating (a) identifying peptides which bind the receptor by the compound which modulates the biological activity of a receptor computating activity of a compound by (i) providing a panel of c the receptor is now the receptor defect of a compound by (i) providing a panel of c in, where the effect of a number of reference substances known to modulate the biological activity of the receptor on the binding of each member of the panel is known and is characterised as a reference of ingerprint for each reference substance, (ii) gereening a test substance fingerprints and (iv) predicting the cest fingerprint to the receptor to determine its effect on the binding of each member of the panel to the receptor, thereby the binding of each member of the panel to the receptor, thereby the binding at test fingerprint for the test substance, (iii) gereening a test substance with a set of particle which binds a vertebrate, mammalian, preferably human receptor, can intracellular, nuclear, oestrogen or androgen receptor. The identified peptides which binds a vertebrate, mammalian, preferably human receptor, can intracellular, nuclear, oestrogen or androgen receptor. The identified peptides which binds to the receptor are useful for predicting the receptor-modulating activity of a compound (e.g. ant/agonists).

The receptor-binding library members are useful for predicting the receptor binding the receptor activity of small organic molecules, suitable for pharmaceutical use of other condities of the sevent adv
                                                                                                                                                                                                                                                                                                                                                                                                   밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical cimaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations conditions for genetic disorders or other traits to assess biodiversity amino acid sequences of the invention.

CC and to produce other types of data and products dependent on DNA and CC amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed car for who, which label for generates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fifty.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the

The sequence is lacking part of the C-terminus of the protein. The gene sequence we isolated from a cDNA library from tobacco leaves using a probe derived from the sequence of the sycamore (Acer pseudoplantanus) laccase gene. The gene can be used to transform plant cells for producing transgenic plants having a reduced or altered lighin content, for improved digestibility of forage crops, for paper manufacture. Plants with increased lighin content may have better resistance to parasites.
          New isolated polynucleotide and encoded polypeptides, useful diagnostics, forensics, gene mapping, identification of mutat responsible for genetic disorders or other traits and to assebiodiversity -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC polypertide (II) sequences. (I) is useful as hybridisation probes, CC polyperase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques CC to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical cimaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations companishes for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO or format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Sequences AAU39105-AAU68017 represent Propionibacterium acnes polypeptides. The proteins and their associated DNA sequences the treatment, prevention and diagnosis of medical conditions

are used in

Example 1; SEQ ID No 5950; 1069pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                                                                                                                                                                  Propionibacterium acnes polypeptides and nucleic acids useful vaccinating against and diagnosing infections, especially use treating acne vulgaris -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (BLISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the

    The invention relates to novel isolated polypeptides (I), and polynucleotides (II). (II) and the antibody to (I) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune disorders (e.g. rheumatoid arthritis), inflammatory conditions, organ transplant rejections and graft versus host disease, infectious diseases (e.g. hepatitis (), bleeding disorders, haemoglobin abnormalities and other blood-related disorders (sickle cell annemia), myeloproliferative disorders, primary haematopoletic disorders, hyperproliferative disorders (e.g. Gaucher's disease and cancer), neurodegenerative disorders (e.g. Gaucher's disease and cancer), neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-NOV-2000;

```

immune

The invention relates to human nucleic acids the encoded polypeptides (AAM38642-AAM42213) immunosuppressant and cytostatic activity. The

and cytostatic activity. The polynucleotides are useful

with

(AAI57798-AAI61369)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilization of the activities such as: Immune system suppression, activities the activities such as: Immune system suppression,
                                                                                                                                         Zhao
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAM41652;

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletion in a patient's genome that affect the activity of P by expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activity. Inhibit activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C.N.S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAG75478;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data specification.

                                            Polynucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AAB58106 - AAB58548. Lung cancer associated proteins and polynucleotide sequences, their agonists, and antagonists may have neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular active general; vulnerary; gastrointestinal general; nephrotropic; antiinfective; gynecological; or antibacterial activity. The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences may be used for detection of lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                       antigens, userui roz

Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases. Polynucleotide sequences AAF18425 - AAF18433 and peptide AAB58549 are used in the course of the invention for the identification and characterisation of the polynucleotide and protein

Submitted (JUN-1998) to the EMBL/GenBank/DDBJ databases.

C. I-FUNCTION: CIRCADIAN REGULATOR THAT MAY ACT AS A TRANSCRIPTION CC FACTOR. BEHAVES AS A NEGATIVE ELEMENT IN CIRCADIAN TRANSCRIPTIONAL LOOP, DOES NOT APPEAR TO BIND DNA, SUGGESTING INDIRECT TRANSCRIPTIONAL INHIBITION. EXPRESSION OSCILLATES WITH A 24 HR CC RHYTHM IN THE SUPRACHIASMATIC NUCLEUS (SCN) AND THE WHOLE EYES.

CC RHYTHM IN THE SUPRACHIASMATIC NUCLEUS (SCN) AND THE WHOLE EYES.

CC OSCILLATIONS ARE MAINTAINED UNDER CONSTANT DARKNESS AND ARE COSCILLATIONS. THEE IS A 4 HOUR CC RESPONSIVE TO CHANGES OF THE LIGHT/DARK CYCLES. THERE IS A 4 HOUR CC TIME DELAY BETWEEN PERI AND PERZ OSCILLATIONS. THE EXPRESSION CC INTERPEAR TO ORIGINATE FROM RETINA.

CC INTERPEDIAL LOCATION: Nuclear (POLENLIA).

CC INTESUBACETIVE DAY. CONSTITUTIVE EXPRESSION IN SCN DURING CONTINGUES SPECIFICITY: IN THE BRAIN, HIGH EXPRESSION IN THE CORNU AMMONIS CONTINGUES OF THE HYPPOCAMPUS. ALSO EXPRESSED IN THE SUBJECTIVE DAY. CONSTITUTIVE EXPRESSION IN THE CORNU AMMONIS OF THE HYPPOCAMPUS. ALSO EXPRESSED IN THE SUBJECTIVE AND THE GLOWERULI OF THE OLFACTORY BULB, AND AT A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

J. Bacteriol. 166:162-172(1986).

-i- FUNCTION: THE KEY ENZYMATIC REACTIONS IN NITROGEN FIXATION ARE CAPALYZED BY THE NITROGENASE COMPLEX, WHICH HAS 2 COMPONENTS: THI IRON PROTEIN AND THE MOLYBDENUM-IRON PROTEIN.

-i- CAPALYZIC ACTIVITY: 8 reduced ferredoxin + 8 H(+) + N(2) + 16 ATI = 8 oxidized ferredoxin + 2 NH(3) + 16 ADP + 16 phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the European Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            anchored membrane proteins.";
J. Biol. Chem. 268:17539-17546 (1993).
-i- FUNCTION: ACTS AS A RECEPTOR FOR UROKINASE PLASMINOGEN ACTIVATOR.
PLAYS A ROLE IN LOCALIZING AND PROMOTING PLASMIN FORMATION.
MEDIATES THE PROTEOLYSIS-INDEPENDENT SIGNAL TRANSDUCTION
ACTIVATION EFFECTS OF U-PA. IT IS SUBJECT TO NEGATIVE-FEEDBACK
REGULATION BY U-PA WHICH CLEAVES IT INTO AN INACTIVE FORM.
-i- SUBGULIT: Monomer (Probable).
-i- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor
(1soform 1). Secreted (isoform 2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PARTIAL SEQUENCE.

-!- SUBUNIT: Forms either a homodimer or a heterodimer with a related family member (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear (Potential).
-!- SIMILARITY: BELONGS TO THE COE FAMILY.
